

WILDFIRE REHABILITATION

- Phases of rehabilitation following wildfires on federal lands include:
 - Fire Suppression Repair
 - Emergency Stabilization-Burned Area Emergency Response (BAER)
- **Fire Suppression Repair** is a series of immediate post-fire actions taken to repair damages and minimize potential soil erosion and impacts resulting from fire suppression activities and usually begins before the fire is contained, and before the demobilization of an Incident Management Team. This work repairs the hand and dozer fire lines, roads, trails, staging areas, safety zones, and drop points used during fire suppression efforts.
- **Emergency Stabilization-Burned Area Emergency Response (BAER)** is a rapid assessment of burned watersheds by a BAER team to identify imminent post-wildfire threats to human life and safety, property, and critical natural or cultural resources on **National Forest System** lands and take immediate actions to implement emergency stabilization measures before the first major storms. Fires result in loss of vegetation, exposure of soil to erosion, and increased water runoff that may lead to flooding, increased sediment, debris flows, and damage to critical natural and cultural resources. BAER actions such as: seeding, mulching, installation of erosion and water run-off control structures, temporary barriers to protect recovering areas, and installation of warning signs may be implemented. BAER work may also replace safety related facilities; remove safety hazards; prevent permanent loss of habitat for threatened and endangered species; invasive species rapid response actions; and protect critical cultural resources.

Slide Post-Fire BAER Assessment information is available at <http://inciweb.nwcg.gov/incident/3884/>.
