

Where there's SMOKE...

Grand Canyon National Park

Smoke impacts due to the Watson Prescribed Fire

Why is there smoke?

- The Watson Prescribed Fire is being implemented to maintain the role of fire in a fire-adapted ecosystem
- Smoke may settle into the Canyon in the evening and will lift out during the day as temperatures increase
- Visibility could be reduced during increased fire activity

Fire management crews are working to reduce accumulations of forest fuels and to enhance safety and forest health. We appreciate your understanding during this process.
