The Gila National Forest (GNF) Burned Area Emergency Response (BAER) team has begun its assessment of National Forest System (NFS) lands impacted by the Black Fire located 24 miles north of Mimbres, New Mexico, on the Black Mountain Range. Due to the large size and ongoing active fire behavior on this wildfire, the BAER team may need to divide the burned area into two phases for assessment and analysis, beginning in the cooler and safer areas of the fire.

After a large wildfire, special actions may be necessary to provide for public and community safety and protect critical natural and cultural resources from post-fire events like soil erosion and flooding. The BAER program uses ground and aerial surveys, satellite imagery and computer models to evaluate conditions and recommend emergency treatments to protect NFS values at risk from further damage.

BAER teams focus on emergency actions necessary to protect human life and safety, property, and natural and cultural resources, including affected watersheds. BAER assessments identify unacceptable risks on federal lands from post-fire threats and help land managers prepare burned areas for potential threats from rainstorms. Burned areas often experience increased soil erosion and runoff from rainstorms.

The Forest Service BAER team assessing the Black Fire consists of hydrologists, soil scientists, road engineers, biologists, archaeologists, recreation specialists, and geographic information system (GIS) specialists. The first step in the BAER assessment process is taking pre-fire and post-fire satellite imagery and data to produce a soil burn severity map, which provides baseline information on changed watershed conditions and potential watershed impacts from the fire. The BAER team’s assessment report will include recommended emergency stabilization treatments and actions.

The BAER team will coordinate and share information from its assessment with other federal agencies, including the Natural Resources Conservation Service (NRCS), National Weather Service (NWS) and US Geological Survey (USGS) as well as state agencies and local counties and municipalities who work with adjacent and downstream private homeowners, landowners, and businesses to prepare for potential post-fire flooding and debris flow impacts. NRCS is a federal agency that has post-fire responsibilities on private lands both within and downstream of burned areas.

Homes or businesses that could be impacted by flooding from federal land that result from wildfires may be eligible for flood insurance coverage from the National Flood Insurance Program (NFIP). Information about NFIP is available through FEMA at www.fema.gov/national-flood-insurance-program, or www.floodsmart.gov/wildfires. Other flood preparedness information is available at www.ready.gov/floods at www.floodsmart.gov/.

BAER SAFETY MESSAGE: Everyone near and downstream from the burned areas should remain alert and stay updated on weather conditions that may result in heavy rains and increased water runoff. Flash flooding may occur quickly during heavy rain events – be prepared to act. Current weather and emergency notifications can be found at the National Weather Service website: www.weather.gov/abq/.
