

Las Conchas Fire - July 2011

LEGEND

Severity

-  High
-  Moderate
-  Low
-  Unburned
-  Unclassified
-  Fire Perimeter (7/13/2011)

Disclaimer: National Interagency BAER Team. The BAER Team chose to lock-in the fire perimeter on July 13, 2011 in order to expedite full and accurate analysis for all of the team's disciplines. The soil burn severity within this perimeter was recognized as final for the purpose of consistent analysis on July 18, 2011. All areas that have a value of unburned, low, moderate, or high soil burn severity were delineated using a variety of methods including satellite imagery, on-the-ground mapping, and aerial mapping by BAER Team members. There are a few areas with an undetermined soil burn severity due to cloud coverage during the satellite image capture. The Team determined that these areas resulted in a minimal overall contribution to the assessment of risk. The Team also recognizes the burn severity outside of the July 13 perimeter and will evaluate this area at a later date.
